

ABSTRACT OF THE DISCLOSURE

A receptacle for vehicle booster cable with a clamp has a body for receiving a clamp. The body has an open entrance end and a closed stopping end. A pair of protrusions is radially and inwardly protruded from the opposite sides of the open entrance end. Their shape matches with the recesses provided on the outer side surface of handgrip portion of the clamp so as to maintain the clamp in the body in a snap fasten manner when the clamp is inserted into the receptacle while the clamp is not in use.
